Image Handling

This example template shows how to use either Base64 encoded images or links to image files to include inline images in your templates.

Placeholder Examples:

Using an image placeholder added by the Document Generation Add-on for Word. Be sure the aspect ratio of the placeholder matches the image. Otherwise, the image may be stretched.

Figure 1: This image uses Base64 data in the JSON

Figure 2: This image uses a URL in JSON

Inline Examples:

The first three images use an inline HTML style <img> tag with the height and width properties set to different sizes. Both the height and width must be set for the settings to take effect.

```
<img height='125' width='93' src='https://…images/odin.jpeg'>
```

The last image uses HTML inline styles to set the hight and width.

```
<img style='height: 250px; width: 187px;' src='https://…images/odin.jpeg'>
```
